

(11)

Accuracy in thinking rests upon discrimination, ~~and~~  
~~which rests~~  
~~discrimination~~, in turn, ~~rests~~ upon sensitivity. Dis-  
crimination is skill in proper evaluation which comes  
with the development of sensitivity or natural perception  
or intelligence, the keenness of which depends upon  
how thoroughly it grows to see into itself. Proper  
evaluation leads to the truest value, to the accurate  
value in reference to an end sought. The question now  
is, to discriminate between ends sought; that is, to  
select among our ends those which are of the highest  
worth and standard.

Where is this?
